

Apex Systems

Secure architecture for a resilient procurement platform

Prepared for: Synthetic Enterprise Procurement Program

Proposal ID: DEMO-2026-APEX_SYSTEMS

All organizations, amounts, references, and project details in this document are fictional and created for classroom demonstration.

Executive Summary

Apex proposes a modular cloud procurement platform with a well-defined API gateway, event-driven services, and isolated data domains. The design is technically detailed and security-forward. Delivery is planned over 24 weeks, and the fixed implementation price is the highest in this fictional competition.

Understanding of the Requirement

The buyer needs a secure, scalable supplier and purchasing workflow that integrates with an existing ERP, supports auditable approvals, and provides role-based access across business units.

Proposed Solution

Apex will deploy a containerized service tier behind a managed API gateway. The proposal names REST interfaces, an asynchronous event bus for status changes, a relational transaction store, and a separate analytics warehouse. Environments are separated for development, test, and production. The integration design includes versioned APIs and retry queues, though the buyer's legacy ERP connector is subject to discovery.

Implementation Approach and Timeline

24 weeks: discovery and architecture (weeks 1-4); foundation and identity integration (5-9); procurement workflows and ERP adapter (10-16); security testing and migration rehearsal (17-21); acceptance and launch (22-24). The schedule is moderate and reserves three weeks for acceptance.

Team Structure

A delivery lead, solution architect, two backend engineers, integration engineer, QA lead, and fractional security specialist. Apex proposes a named delivery lead after contract signature; individual CVs are not included in this response.

Apex Systems | Delivery and Commercial Proposal

Milestones and Governance

M1 approved architecture; M2 identity and environments ready; M3 end-to-end ERP sandbox transaction; M4 penetration test closure; M5 buyer acceptance and production handover. A weekly steering review and fortnightly demonstrations are proposed.

Price Table (fictional USD)

Work package	Fee (fictional USD)
Discovery and architecture	\$185,000
Platform and integrations	\$520,000
Security and launch	\$155,000
Total fixed implementation	\$860,000

Pricing Assumptions

Price assumes one ERP instance, up to three business units, buyer-provided test credentials, and standard weekday access to subject-matter experts. Hosting and third-party license fees are excluded. Change requests are time-and-materials at \$210/hour after written approval.

Security Controls

Apex specifies TLS 1.2+ in transit, AES-256 at rest, managed key rotation, SSO using OIDC, least-privilege roles, immutable administrative audit events, and quarterly vulnerability scans. A third-party penetration test is included before launch. The response describes alignment with ISO 27001 control practices but does not claim a certification; a certificate was not supplied.

Compliance

Data residency can be configured for the buyer's selected region. Retention and deletion rules will be mapped in discovery. The response does not provide a SOC 2 report or a formal privacy impact assessment.

Apex Systems | Assurance and Operations

Risk Controls

Legacy ERP data quality and connector behavior may affect schedule; the buyer must provide a sandbox by week 2. The fixed price excludes hosting and licenses. Apex proposes a joint risk register reviewed weekly and a rollback rehearsal before launch.

Support Model

Thirty days of hypercare are included, with business-hours support and a one-hour response target for severity-one incidents. A 24/7 support tier is available under a separate annual service agreement. A named customer success manager is assigned at launch.

Relevant Experience

Apex reports completing six procurement workflow programs in the past five years, including two ERP integrations for organizations with more than 2,000 users. Project descriptions are summarized; customer names are withheld in this fictional proposal.

References

Two reference calls can be arranged after shortlist selection. Contact details and signed permission letters are not included in this response.

Proposal Notes

This response is a synthetic educational example. Any missing detail should be clarified during due diligence; no unstated control, capability, or commercial term should be assumed.
